The new wireless package

The new wireless package (since vers. 6.37), in RouterOS brought these features:

- The DFS “settings”
- Background scan
- Wireless Scan features (on files, etc.)
- Station Roaming
- Repeater function
- New Wireless Interfaces

The new wireless package

My MUM presentation in Milan (2017) about the v 6.37 features :

UNITED STATES ON APRIL 28 - 29, 2016

The evolution of the wireless package

The new wireless features from v 6.40:

- nv2-downlink-ratio
- NV2 APs synch
- and much more. .

nv2-downlink-ratio

- A new feature available since RouterOS 6.40
- Will allow you to setup the download/upload ratio from the AP to the stations.
- Can be setup in two ways:
 - **Dynamic-downlink**
 - **Fixed-downlink**

nv2-downlink-ratio

Interface <wlan2>

Nstreme NV2 Tx Power Current Tx Power Status Traffic ...

TDMA Period Size: auto

Cell Radius: 30 km

Security

Preshared Key: Nv2-usuario

Mode: dynamic downlink

Downlink Ratio: 50 %

Sync Secret:

Queue Count: 2

QoS: default

nv2-downlink-ratio

- This new feature will allow you to give “more [*transmission*] time” for the download (*or upload*) of the stations
- Giving your customer more download (*or upload*) bandwidth

nv2-downlink-ratio

- The default value is 50
- The minimum value is 20
- The maximum is 80

nv2-uplink-ratio

- The Uplink ratio is automatically calculated from the downlink-ratio value.

For example:

- With downlink-ratio=70 -> Uplink = 30
- With downlink-ratio=60 -> Uplink = 40

nv2-mode=fixed-downlink

- This new feature will allow you to **statically** schedule “more time” for the download of the stations.
- Setting up a value of 70 the AP will schedule:
 - 70% of the time for the download of the clients
 - 30% of the time for the upload of the clients

nv2-mode=fixed-downlink

Interface <wlan2>

Nstreme NV2 Tx Power Current Tx Power Status Traffic ...

TDMA Period Size: auto

Cell Radius: 30 km

Security

Preshared Key: Nv2-usuario

Mode: fixed downlink

Downlink Ratio: 70 %

Sync Secret:

Queue Count: 2

QoS: default

nv2-mode=dynamic-downlink

- This feature will allow you to let the AP **dynamically** assign the time slots for the stations.
- **BUT:** when link get fully saturated it will use the `Nv2-downlink-ratio` that you specified (the default is 50)

nv2-mode=dynamic-downlink

Interface <wlan2>

Nstreme NV2 Tx Power Current Tx Power Status Traffic ...

TDMA Period Size: auto

Cell Radius: 30 km

Security

Preshared Key: Nv2-usuario

Mode: dynamic downlink

Downlink Ratio: 50 %

Sync Secret:

Queue Count: 2

QoS: default

Real life bandwidth

Delivering bandwidth to one station is simple, to more stations is difficult, because of:

- Different distances of the stations
- Different setup and/or data rates
- Interference
- The time that the AP “loses” for managing time slots for the stations
- And so on

Real life test

We experimented different scenario using different settings, to show you how you can manage more bandwidth, specially in PtMP environment.

Lab1: dynamic-downlink 50

1 concurrent station

2 HT chains

N protocol Ce

Total bandwidth from the AP:

127 Mbps

Lab2: dynamic-downlink 50

9 concurrent stations

2 HT chains

N protocol Ce

Total bandwidth from the AP:

80 Mbps

Lab3: fixed-downlink 70

9 concurrent stations

2 HT chains

N protocol Ce

Total bandwidth from the AP:

106 Mbps

Lab3: fixed-downlink 70

1 station, ratio d 50 -> 127 Mbps

9 stations, ratio d 50 -> 80 Mbps

9 stations, ratio f 70 -> 106 Mbps

9 stations, ratio f 80 -> 125 Mbps

Nv2 AP synchronization

[experimental support]

Nv2 AP synchronization

- Introduced with RouterOS 6.40
- This feature will allow multiple MikroTik Nv2 APs at the same location to coexist in a better fashion by reducing the interference between each other.
- One of the most desired wireless implementations in RouterOS
- Different from other vendors (no GPS)

Nv2 AP synchronization

- This feature will synchronize the transmit/receive “time windows” of APs on the same frequency, so that all “synced MikroTik Nv2 Aps” **transmit/receive at the same time.**
- That allows to reuse the same wireless frequency on the location for multiple APs, giving more flexibility in frequency planning.

Nv2 AP synchronization

SSID: Rede1
Freq: 5600

SSID: Rede2
Freq: 5600

Nv2 AP synchronization

In the scenario there is:

- ONE “master” APs
- MULTIPLE “slaves” APs
- All of them **must** use the **SAME frequency**
- They can have **different SSIDs**
- They can use **different Nv2 encryption password**

Nv2 AP synchronization

But all of them must use the SAME nv2-sync-secret.

They will synchronize using **this** “password”, regardless of the SSID and the Nv2 encryption password.

Nv2 AP synchronization

Interface <wlan2>

Nstreme NV2 Tx Power Current Tx Power Status Traffic ...

Cell Radius: 30 km

Security

Preshared Key: Nv2-usuario

Mode: sync slave

Downlink Ratio: 50 %

Sync Secret: Nv2-sync-usuario

Queue Count: 2

QoS: default

Nv2 AP synchronization

Slave APs will first start to search for a Master AP by matching it against specified "nv2-sync-secret".

After a Master AP is found the Slave AP will calculate the **distance** to the Master AP because it is possible that the Master AP is not located in the same location.

Nv2 AP synchronization

Then the Slave AP starts to operate as AP, adapting the period size and the downlink ratio from the synced Master AP.

In addition after the Slave AP is operational other Slave APs can use this Slave AP to sync with.

Nv2 AP synchronization

```
[lorenzo@Trainer] > interface wireless monitor wlan1

                        notify-external-fdb: no
-- [Q quit|D dump|C-z pause]
```

Nv2 AP synchronization

- Slave AP periodically listens for the Master AP and will check if the "nv2-sync-secret" still matches and adapting the parameters again.
- If the Master AP wireless interface will be disabled/enabled all the Slaves will be also disabled accordingly, then they will start the synchronization process from the beginning.
- If the Master AP will stop to work then the Slave APs will do the same as they do not have sync information.

Nv2 AP synchronization

Please remember that this specific resource is still in the process of development.

More features?

On Tue Mar 20, 2018 12:30 pm Uldis created a topic in the MikroTik forum with the title:

Significant improvement for wireless Nv2 PtMP

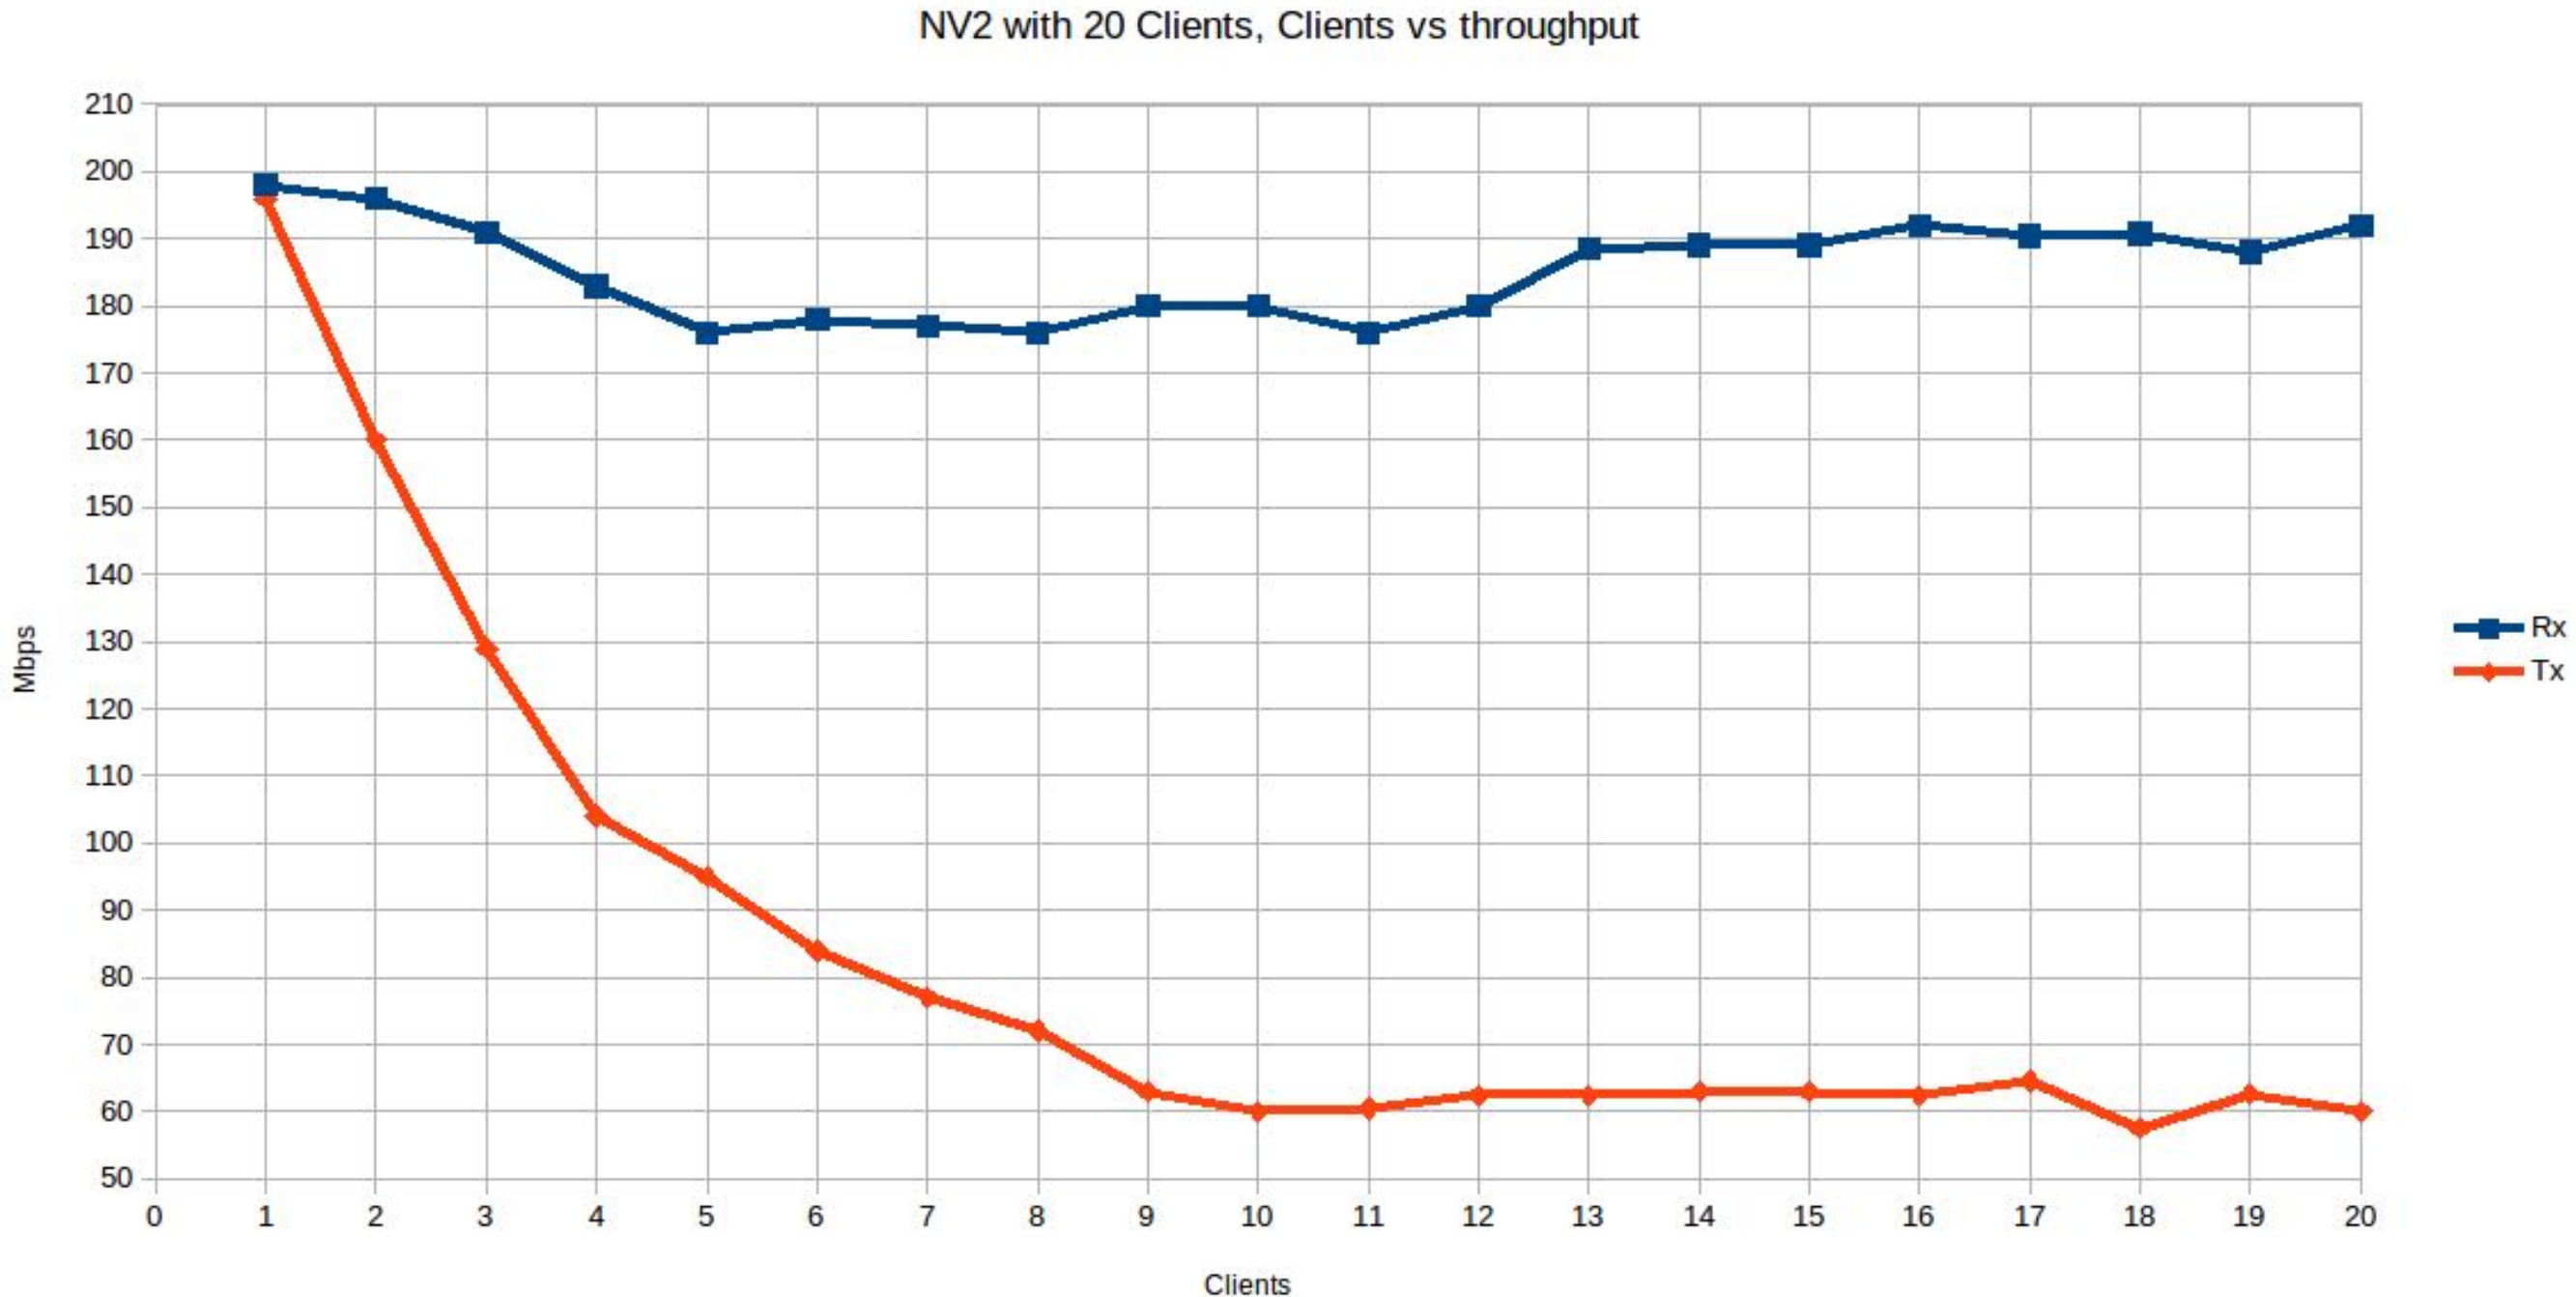

Significant improvement for wireless Nv2 PtMP

MikroTik made significant improvement for wireless **Nv2 PtMP** configurations from the **6.42rc46** version release, where the clients can still use the old version.

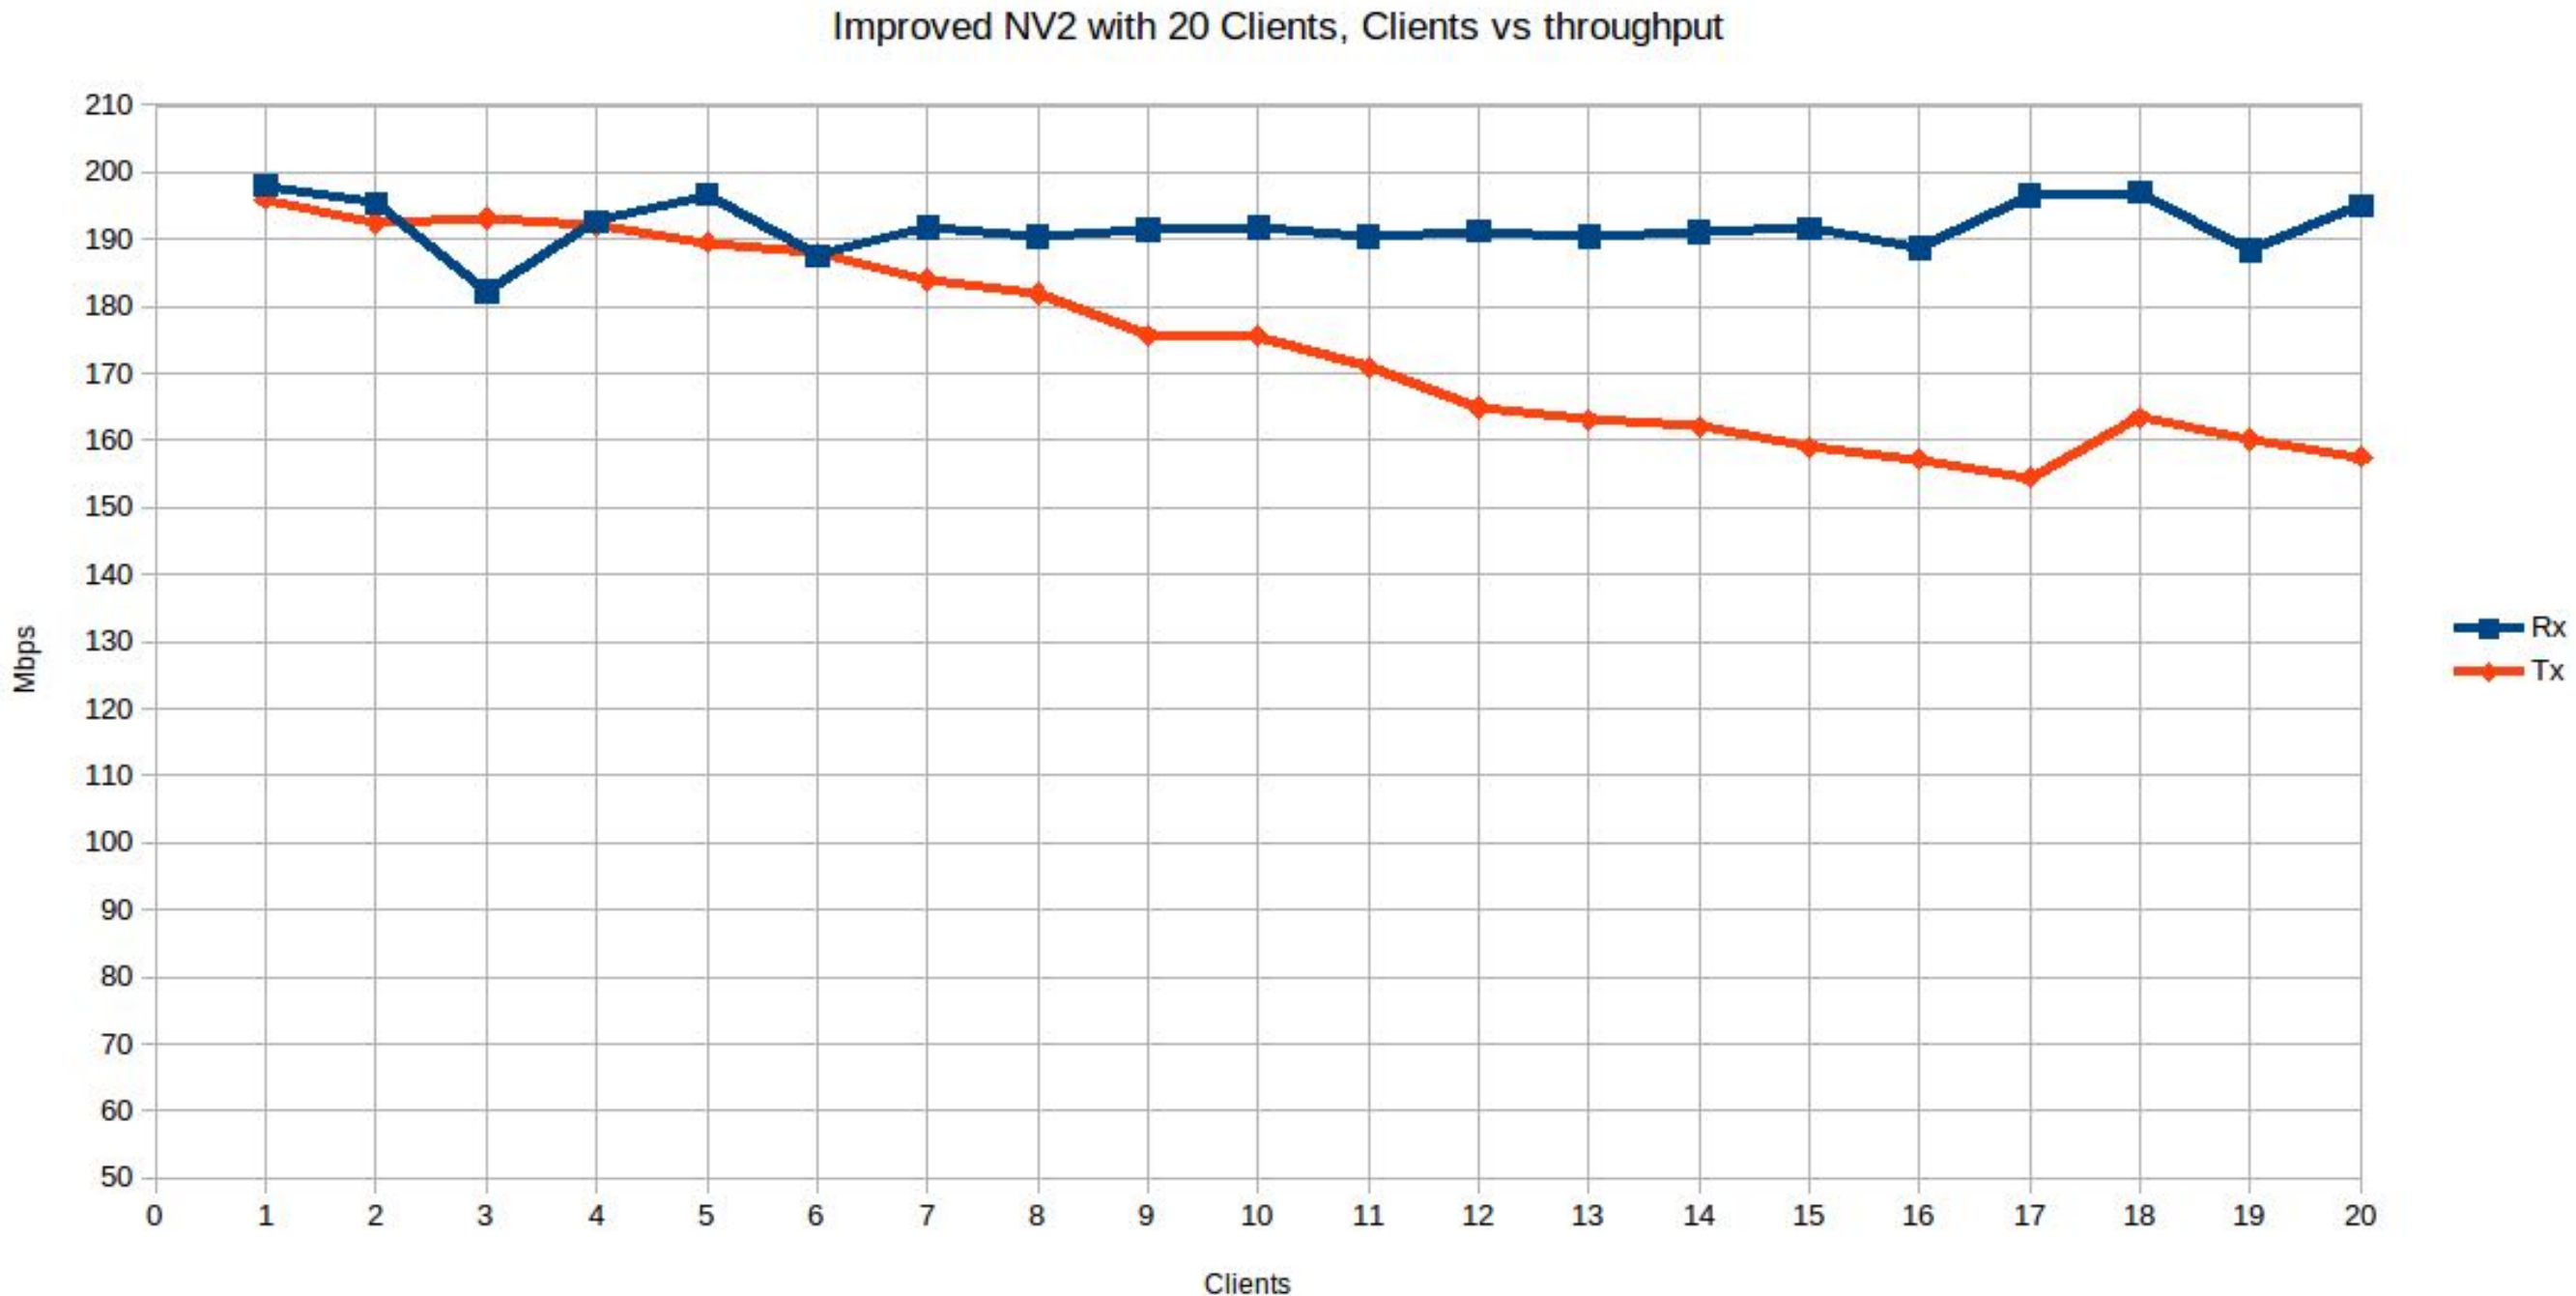

Significant improvement for wireless Nv2 PtMP

Before the improvement (MT Labs)

Significant improvement for wireless Nv2 PtMP

After the improvement (MT Labs)

Significant improvement for wireless Nv2 PtMP

It is still in development, but almost everyone that tried obtained a better aggregated bandwidth from an AP to the clients:

- “only” 20 % more
- 40-50 % more
- 60-65% more

“Live” testing the 6.42rc NV2 PtMP

Tested in a real life outdoor environment, using a Netmetal with:

- 2 chain
- 20 Mhz channel
- 802.11n protocol and Nv2

“Live” testing the 6.42rc NV2 PtMP

The customers distances and devices:

Wrap up

- ✓ I think that MikroTik started to put their hands on the wireless part of RouterOS in a PtMP environment.
- ✓ I hope you enjoyed my presentation and the news in the wireless package since the version 6.40

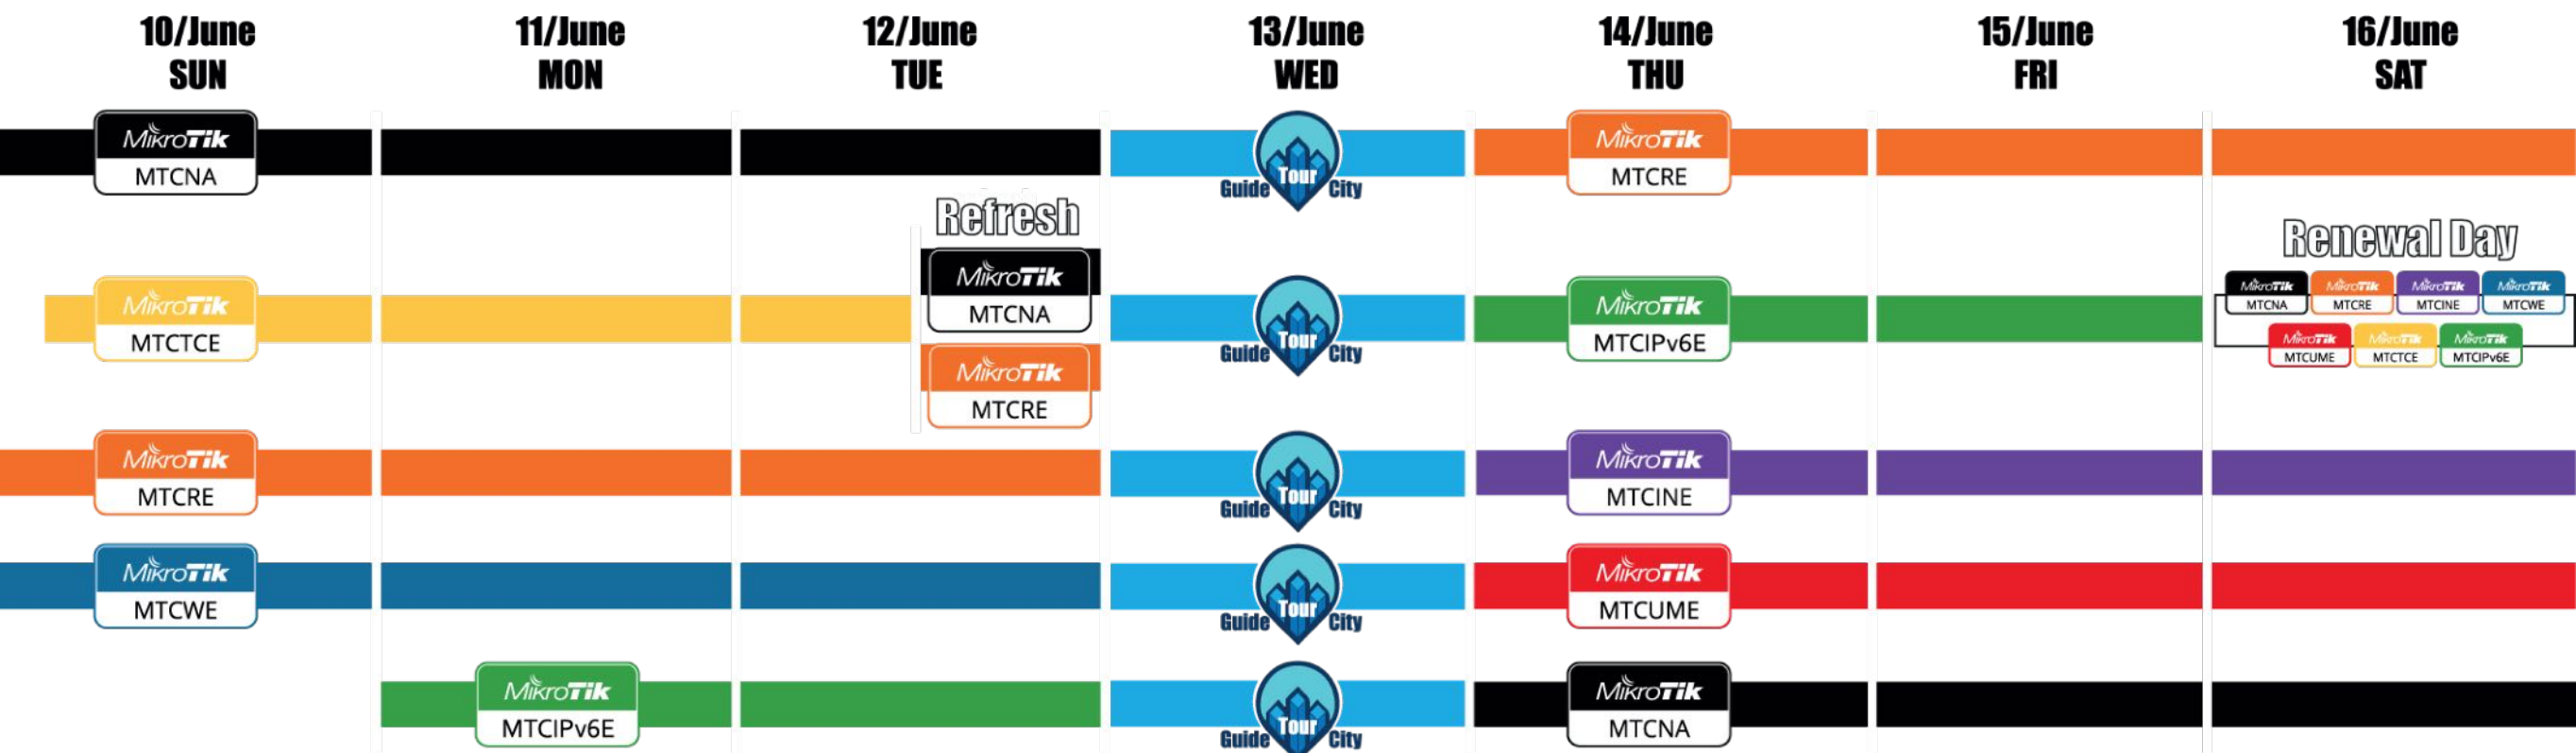

A graphic overlay on a photograph of a modern building with large glass windows. The text 'MIKROTIK' is in white, with a white arc above the 'i'. 'ACADEMY' is in orange with a cracked texture. 'Riga • Bootcamp • 2017' is in white with orange dots.

MIKROTIK ACADEMY Riga • Bootcamp • 2017

CAMP Mikrotik

Riga • Bootcamp • 2018

Thank you!
